

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

SCIENTIFIC JOURNALS.

BOTANICAL GAZETTE, AUGUST.*

Synopsis of the North American Amaranthaceæ, III.: Edwin B. Uline and Wm. L. Bray. An enumeration of the North American species of this order, with synonymy and remarks upon the recognized species and varieties, together with descriptions of new ones. The genera Frælichia, Gossypianthus, Guilleminia, and Cladothrix are treated in this installment. Frælichia interrupta cordata, Gossypianthus lanuginosus Sheldoni and Guilleminia densa aggregata are described as new.

Notes from my Herbarium, III.: WALTER DEANE. In this note Mr. Deane describes his methods of mounting plants. As his herbarium is remarkable for the beauty of the specimens his advice on these matters is especially valuable.

Some Euphorbiaceæ from Guatemala: John P. Lotsy. The last representatives of this order from Guatemala acquired by Capt. John Donnell Smith are here enumerated by Dr. Lotsy. Euphorbia rubrosperma, E. microappendiculata, E. leucocephala, E. chamæpeploides, Croton eluterioides, C. Guatemalensis and Tragia Guatemalensis are described as new. On two double plates three of these new species are figured.

Vegetal dissemination in the genus Opuntia: J. W. Tuomey. Professor Tuomey calls attention to the fact that the persistency with which these cactuses retain their moisture fits them for vegetal dissemination. The prostrate flat-jointed forms spread by rooting where they touch the ground and having the older parts die away, while the cylindrical erect forms have barbed spines by means of which their joints are transported. Few depend upon seed dissemination.

A study of some Anatomical Characters of North American Gramineæ: Th. Holm. In this paper the author concludes the examination of the species of *Leersia* and enumerates the anatomical characters of the leaves by which they can be discriminated.

Daniel Cady Eaton: George E. Davenport. This is a short but appreciative biographical sketch of the late Professor Eaton, by one who has long been associated with him in the critical

*Issued August 15, 1895. 40 pp., 5 pl.

study of the ferns. A portrait accompanies the sketch.

The Nomenclature Question: A Further Discussion of the Madison Rules: B. L. ROBINSON. Dr. Robinson replies to Mr. Coville's criticisms in the July number and again vigorously attacks the doctrine of 'the rejection of thehomonyms.'

Among Briefer Articles is one describing a new genus of Umbelliferæ from Mexico, which the authors, Dr. John M. Coulter and Mr. J. N. Rose, dedicate to Mr. Walter Deane under the name of Deanea, with two species, D. nudicaulis and D. tuberosa; and one by Dr. Trelease, asking for information in regard to the distribution of our species of pignuts. An Editorial vigorously defends the Gazette against the charge, by an anonymous correspondent of the Journal of Botany, of suppressing free discussion of the nomenclature question. Under Current Literature Mr. Charles Robertson reviews MacLeod's 'Fertilization of Flanders Flowers,' and the editors notice a new issue in Ostwald's 'Klassiker der exakten Wissenschaften.' pages of Notes and News conclude the number.

PSYCHE, SEPTEMBER.

W. S. BLATCHLEY continues his account of the winter insects of Vigo county, Ind., adding 26 more species of Hepteroptera. G. B. King finds from repeated observations of frozen nests that Formica obscuripes does not retreat into the lower parts of the nest in winter, but remains practically in all parts excepting close to the surface, though, of course, wholly inactive; some of the parasites are noticed. In a supplement, T. D. A. Cockerell describes a couple of new bees and some new Coccidæ and adds a note on a Mutillid which 'as it runs over the ground . . . looks extremely like a bit of thistle down blown by a gentle breeze.'

NEW BOOKS.

Tables for the Determination of Common Minerals.
W. O. CROSBY. Third edition rewritten and enlarged. Boston, The Author. 1895. Pp. 106.

Fishes, Living and Fossil. Bashford Dean. Columbia University Biological Series III. New York, Macmillian & Co. 1895. Pp. xiv+300.
